

How the Coast Works...

Static Physical Features of the Coast Between The River Tyne and Flamborough Head

The basic structure of the coast determines:

- Our use of the coast;
- The interest we have in the coast;
- The risks to this use and interest.

Therefore, it influences our management of the coast

The important geology of this coastline provides opportunity for education, awareness and scientific research as to how our environment has changed.

This awareness underpins our understanding of how the coast works and how it may develop in the future.
